

For each circle controlled by active player, you must first check:

- [spot - 1][spot - 1]
- [spot - 1][spot]
- [spot - 1][spot + 1]
- [spot][spot - 1]
- [spot][spot + 1]
- [spot + 1][spot - 1]
- [spot + 1][spot]
- [spot + 1][spot + 1]

Next disregard all empty and same colored spaces first.
If an opposite color is found, check whether or not
The active players color is on the other side of that path
Once an empty space is found at the other end, a valid move
is determined at that position.
Each path goes in the direction of the found piece (diagonal
or straight up, down, left, or right

Once the move is selected, all pieces in that chosen path
must be flipped to the corresponding active player's color
(Need to keep track of paths to determine which pieces to
flip)
